## ABSTRACT

This template helps you to create a properly formatted  $\LaTeX$  manuscript. `\beginabstract ... \endabstract` and `\begin{keyword} ... \end{keyword}` which contain the abstract and keywords respectively.  
Each keyword shall be separated by a `\sep` command.

---

## 1. Introduction

The Elsevier cas-dc class is based on the standard article class and supports almost all of the functionality of that class. In addition, it features commands and options to format the

- document style
- baselineskip
- front matter
- keywords and MSC codes
- theorems, definitions and proofs
- lables of enumerations
- citation style and labeling.

This class depends on the following packages for its proper functioning:

1. natbib.sty for citation processing;
2. geometry.sty for margin settings;
3. fleqn.clo for left aligned equations;

---

\* This document is the results of the research project funded by the National Science Foundation.

\*\* The second title footnote which is a longer text matter to fill through the whole text width and overflow into another line in the footnotes area of the first page.

This note has no numbers. In this work we demonstrate  $a_b$  the formation  $Y_1$  of a new type of polariton on the interface between a cuprous oxide slab and a polystyrene micro-sphere placed on the slab.

<sup>1</sup>This is the first author footnote. but is common to third author as well.

<sup>2</sup>Another author footnote, this is a very long footnote and it should be a really long footnote. But this footnote is not yet sufficiently long enough to make two lines of footnote text.

4. graphicx.sty for graphics inclusion;
5. hyperref.sty optional packages if hyperlinking is required in the document;

All the above packages are part of any standard  $\LaTeX$  installation. Therefore, the users need not be bothered about downloading any extra packages.

## 2. Installation

The package is available at author resources page at Elsevier (<http://www.elsevier.com/locate/latex>). The class may be moved or copied to a place, usually, `$TEXMF/tex/latex/elsevier/`, or a folder which will be read by  $\LaTeX$  during document compilation. The  $\TeX$  file database needs updation after moving/copying class file. Usually, we use commands like `mktexlsr` or `texhash` depending upon the distribution and operating system.

## 3. Front matter

The author names and affiliations could be formatted in two ways:

- (1) Group the authors per affiliation.
- (2) Use footnotes to indicate the affiliations.

See the front matter of this document for examples. You are recommended to conform your choice to the journal you are submitting to.

## 4. Bibliography styles

There are various bibliography styles available. You can select the style of your choice in the preamble of this document. These styles are Elsevier styles based on standard styles like Harvard and Vancouver. Please use Bib $\TeX$  to generate your bibliography and include DOIs whenever available.

Here are two sample references: [1] [1, 2] [1, 3]

**Figure 1:** The evanescent light - IS quadrupole coupling ( $g_{1,l}$ ) scaled to the bulk exciton-photon coupling ( $g_{1,2}$ ). The size parameter  $kr_0$  is denoted as  $x$  and the PMS is placed directly on the cuprous oxide sample ( $\delta r = 0$ , See also Table 1).

## 5. Floats

Figures may be included using the command, `\includegraphics` in combination with or without its several options to further control graphic. `\includegraphics` is provided by `graphic[s,x].sty` which is part of any standard  $\text{\LaTeX}$  distribution. `graphicx.sty` is loaded by default.  $\text{\LaTeX}$  accepts figures in the postscript format while  $\text{pdf}\text{\LaTeX}$  accepts `*.pdf`, `*.mps` (metapost), `*.jpg` and `*.png` formats.  $\text{pdf}\text{\LaTeX}$  does not accept graphic files in the postscript format.

The `table` environment is handy for marking up tabular material. If users want to use `multitrow.sty`, `array.sty`, etc., to fine control/enhance the tables, they are welcome to load any package of their choice and `cas-dc.cls` will work in combination with all loaded packages.

**Table 1**

This is a test caption. This is a test caption. This is a test caption. This is a test caption.

Col 1	Col 2	Col 3	Col4
12345	12345	123	12345
12345	12345	123	12345
12345	12345	123	12345
12345	12345	123	12345
12345	12345	123	12345

## 6. Theorem and theorem like environments

`cas-dc.cls` provides a few shortcuts to format theorems and theorem-like environments with ease. In all commands the options that are used with the `\newtheorem` command will work exactly in the same manner. `cas-dc.cls` provides three commands to format theorem or

theorem-like environments:

```
\newtheorem{theorem}{Theorem}
\newtheorem{lemma}[theorem]{Lemma}
\newdefinition{rmk}{Remark}
\newproof{pf}{Proof}
\newproof{pot}{Proof of Theorem \ref{thm2}}
```

The `\newtheorem` command formats a theorem in  $\text{\LaTeX}$ 's default style with italicized font, bold font for theorem heading and theorem number at the right hand side of the theorem heading. It also optionally accepts an argument which will be printed as an extra heading in parentheses.

```
\begin{theorem}
  For system (8), consensus can be achieved with
   $\|T_{\omega z}\| \dots$ 
  \begin{eqnarray}\label{10}
  \dots
  \end{eqnarray}
\end{theorem}
```

**Theorem 1.** *For system (8), consensus can be achieved with  $\|T_{\omega z}\| \dots$*

..... (1)

The `\newdefinition` command is the same in all respects as its `\newtheorem` counterpart except that the font shape is roman instead of italic. Both `\newdefinition` and `\newtheorem` commands automatically define counters for the environments defined.

The `\newproof` command defines proof environments with upright font shape. No counters are defined.

## 7. Enumerated and Itemized Lists

`cas-dc.cls` provides an extended list processing macros which makes the usage a bit more user friendly than the default  $\text{\LaTeX}$  list macros. With an optional argument to the `\begin{enumerate}` command, you can change the list counter type and its attributes.

```
\begin{enumerate}[1.]
\item The enumerate environment starts with an optional
  argument '1.', so that the item counter will be suffixed
  by a period.
\item You can use 'a' for alphabetical counter and '(i)'
  for roman counter.
\begin{enumerate}[a]]
  \item Another level of list with alphabetical counter.
  \item One more item before we start another.
  \item One more item before we start another.
  \item One more item before we start another.
  \item One more item before we start another.
```

Further, the enhanced list environment allows one to prefix a string like 'step' to all the item numbers.
